SVPlayer视频文件hash算法 (草)

Version. 0.1 Date: 2008-11-04

方案

取文件第4k位置,再根据floor(文件总长度/3)计算,取中间2处,再取文件结尾倒数第8k的位置,4个位置各取4k区块做md5。共得到4个md5值,均设为索引。可以进行智能匹配。(可以应用于不完全下载的p2p文件)

Sample

```
56
       CString CSVPhash::ComputerFileHash(CString szFilePath)
57
58
               int stream:
               errno t err;
59
60
                int6\overline{4} offset[4];
               DWORD timecost = GetTickCount();

CString szRet = _T("");

err = _wsopen_s(&stream, szFilePath, _O_BINARY|_O_RDONLY , _SH_DENYNO , _S_IREAD );
61
62
63
64
               if(!err){
6.5
                           _int64 ftotallen = _filelengthi64( stream );
                         \overline{\text{if}} (ftotallen < 8192) \overline{\{}
66
67
                                   //a video file less then 8k? impossible!
68
69
                         }else{
                                   offset[3] = ftotallen - 8192;
70
71
                                   offset[2] = ftotallen / 3;
                                   offset[1] = ftotallen / 3 * 2;
72
                                   offset[0] = 4096;
73
74
                                   CMD5Checksum mMd5;
75
                                   BYTE bBuf[4096];
                                   for (int i = 0; i < 4; i++) {
76
                                             lseeki64(stream, offset[i], 0);
//hash 4k block
77
78
                                             int readlen = _read( stream, bBuf, 4096);
CString szMD5 = mMd5.GetMD5( bBuf , readlen);
79
80
81
                                             if(!szRet.IsEmpty()){
                                                       szRet.Append( T(";") );
82
83
                                         szRet.Append(szMD5);
8
85
                                   }
86
                         _close(stream);
87
88
89
               timecost = GetTickCount() - timecost;
90
               return szRet;
93
       }
```

参数格式

各段hash之间以";"分隔。
